

7 Habits of Highly Effective DevSecOps Teams

Security teams are responsible for safeguarding assets in the cloud to maintain compliance and eliminate threats. However, silos between security teams and application development teams can cause critical security blindspots that have disastrous consequences. In today's complex and dynamic cloud environments, it is essential for companies to build DevSecOps teams that will sit at the intersection of the development, runtime and security strategy for the best approach to risk-based vulnerability management. Download to gain actionable insights on how to address the technical, cultural, and organizational changes necessary to effectively manage cloud security and operational risks across your organization.
