

# 5 Key OT Security Use Cases For The DoD: Safeguarding OT Networks and CyberPhysical Systems

Operational Technology (OT) is at the heart of daily operations for the Department of Defense (DoD). It's in the utility facilities for military bases, the manufacturing setups that build essential equipment and supplies and the building management systems that automate and secure facilities, including the highly restricted ones. Its presence everywhere shows how crucial it is. Cyberphysical systems (CPS), which include operational technology (OT), the internet of things (IoT) and IT, can leave DoD networks open to attack through internal and external compromise. Read this white paper to understand the 5 key uses cases for OT in the DoD.
