

Cloud-native Applications Survey

Today's businesses are evolving rapidly to meet the demands of their customers, but traditional applications often do not meet the requirements. IT organizations are trying to keep their businesses running while migrating to modern, future-proof approaches.

To understand cloud native application trends, ESG surveyed 387 IT professionals at organizations in the U.S. responsible for evaluating, purchasing, managing, and building application infrastructure.

This study has several goals:

- Understand how businesses are approaching cloud native application orchestration.
- Investigate how teams are solving complex issues at different layers of the application stack.
- Explore microservices-based, containerized application environments, including benefits and challenges.
- Gain insight into the impact of developer velocity.
