

Demystifying GemFire and its Features

If you are looking for a database that is highly available, dynamically scalable - both horizontally and vertically and supports global data distribution, you won't want to miss this talk as we dive into GemFire and its features. We will cover some of GemFire's latest features and why they are important:

- Ultra-low latency key value store.
- VMware GemFire for Redis Apps add-on, that enables compatibility between Redis applications and GemFire, unlocking enterprise-ready features for your Redis applications.
- JSON Document Storage and Querying.
- Event Driven Architectures and how GemFire can support them.

The webinar would also include some coding examples around Spring Data and touch upon how to size a GemFire installation.
