

# Cisco Cyber Threat Trends Report: From Trojan Takeovers to Ransomware Roulette

You can't protect against what you can't see. Cisco resolves billions of DNS requests every day and with every connection to website or application, we gain insight into threats being staged all over the internet. From this data, we can see how bad actors use the internet to exploit vulnerabilities and identify which threats are on the rise. The Cisco Cyber Threat Trends report can help you discover the real-life threats your organization could be at risk for and how DNS-layer security and security service edge user protection helps you stop threats before a connection is made.
