

# Oracle Migration to Postgres

Migrations off of legacy databases, especially off of Oracle databases, have become a core component of digital transformations. There are multiple business drivers for these migrations, ranging from cost reduction to agility, innovation, and the move to the cloud. Traditionally, customers asked EDB to migrate individual application databases. Today we are increasingly encountering wholesale strategic moves onto open source-based databases. “We have 1000 databases, how can you help us?” has become a standard question asked as part of wholesale digital transformations.
